Abstract:

Occupational safety and health at school is an internationally concerning issue. School is a place of work and is a platform of education for early childhood. However, school also suffers from various risks of safety and health. Recent studies found that school suffers on occupational stress particularly among the teachers. The administration staff as well as the teachers did suffers from MSD and lower back pain. The students, on the other hand also expose to trip hazard, chemical spillage, and the fire hazard due to hazardous school environment. While school is always believed as a safe place for children, action must be taken to counter these issues. One approach is to propose the safety and health risks management. This, however, could only be achieved based on the feedback from the respondent in school in Peninsular Malaysia. Hence, a set of questionnaire was developed to collect the data and to study this issues. At the same time, safety checklist had been adapted for this study to understand the section that is needed to be covered in school.
